What's New In?

Bookmarked the Email Client called Easylist and after using it for about a month decided to try something new in the form of an offline email client with both web and desktop versions. I tried EmailCloak

and I really liked it and did not have any problems with it. My only big problem was that it did not support ICS/HMS on iPhone/Ipad. I am using an iPhone so it was really driving me nuts not being able to read my email. Now that I have found Easylist I think I will switch back to using that. At least until I find a Linux email program that can read my Gmail emails in a sense. That will take more research but I am getting very impatient as I have already been searching this site for days for something
