The administration would like to see the latest Food and Drug Administration approval for the pharmaceutical quetiapine extended to young adult patients with bipolar disorder, according to a briefing for reporters yesterday that Secretary of Health and Human Services Sylvia Burwell held with the Associated Press. Quetiapine, which may be sold as Seroquel in the U.S., is indicated to treat acute manic or mixed episodes associated with bipolar disorder in adults and children and adolescents ages 12 and over. The new request comes on the heels of a newly published report in the New England Journal of Medicine by researchers at Columbia University and several other institutions. In a brief snapshot of the pharmaceutical industry today, one company will be lending its help in a "phase 3" clinical trial that will evaluate the new quetiapine combination drug versus placebo in patients age 25 years and older. From a clinical standpoint, the submission is meaningless, but a business decision, since companies are required by law to report important medical data to the FDA at the end of each year. Overall U.S. sales of antipsychotics among adults 18 and older totaled \$12 billion last year, up 20 percent from 2012. Sales in the U.S. have more than doubled over the last several years, and most of that growth has been driven by the addition of newer antipsychotics to the market. From 2012 to 2017, antipsychotic sales in the U.S. increased 85 percent — to more than \$21 billion. "Lives are affected by this treatment and the lengths people go through to get it," said Dr. Drew Pinsky, a psychiatrist and former host of HLN's "Dr. Drew." "As marketers try to get this drug on the market now to expand the use of antipsychotics, I hope they'll be mindful about how this medication is being prescribed." Pinsky pointed out that the new drug is very safe, but he said it's important to understand that long-term studies involving younger people can be unpredictable and difficult. People of all ages can be helped, but children are particularly vulnerable because of the long-term effects of antipsychotics on brain development and even on the size of the brain, Pinsky said. Possibly the most well-known antipsychotic drug is Zyprexa, often prescribed as a first-choice treatment for schizophrenia. Zyprexa came

Localization of parvalbumin in the nucleus of spinal motoneurons of rat. Using antiserum against parvalbumin, immunolabelling was observed in the spinal cord of the rat, with the highest density of reaction product in large multifused motoneurons. Moderate staining was found in interneurons, principally in the nucleus intercalatus and nucleus gigantocellulare. Light staining was seen in neurones of the nucleus cuneatus and nucleus gracilis. Smaller numbers of neurones in the nucleus dorsalis and nucleus ventralis were also stained. The nucleus gracilis is morphologically specialised to receive sensory input from nociceptive and muscular afferents, and parvalbumin-positive neurons are probably preferentially involved in processing nociceptive information, being rich in opioid peptides.. S. It is peculiar to the Church from the S. P. Augustine, who, at that period, being noted for the profound and acute acuteness of his analysis, was enthralled with one of these Luminaries, and by the reading of one of his treatises, composed a doggerel of eighteen stanzas, celebrating the mystic interview betwixt \_Jerusalem\_ and the Most Blessed Virgin Mary: "Early in the morn of day, nine or ten, St. \_Jerusalem\_ did come all alone: The Arch-angel
