For those who are thinking about the iPad Pro, it is certainly worth considering to get your hands on one. I use it as a replacement for the laptop when I need to work, as I used to do, and it is far superior in just about every aspect but one. That one is getting darkroom apps like RAW Therapee or Capture One Pro away from me, although for now the iPad Pro cannot compete with even a fairly inexpensive DSLR. Even still, having the Personal Document vault on the iPad made it far easier to create images for this review, and it's a LOT easier than fumbling with the files on my laptop. That said, the iPad Pro's screen is no replacement for a "real" monitor. Using it for viewing images without distractions is fine, but if you need to make pixel-by-pixel adjustments it becomes severely limiting. The better approach, of course, is to have a laptop nearby to do that. The Apple Pencil, with its cap that can be flipped to the side, works fine, but it is not quite as good as the *Byron* pencil, which is expensive (here, over 239 USD), and, unless the plug is plugged into the iPad Pro's Lightning port, can't be used separately from the iPad Pro. With the plug connected, it isn't possible to use Lightroom's "Quicken" function for doing any significant edits. There were times when I wanted to use the iPad Pro as a raw image editor when I didn't have my laptop nearby, and that's the only thing that prevented me from making that workstation the best. The issue isn't news. *Adobe Blog* has a great explainer of the iOS/Mac differences. Either way, I'd use a laptop for serious edits - and that's all I'll do with the iPad Pro. The only question is how often.
