Starting out with RAW files, I believe that the inclusion of the new DNG converter, which is actually a new beta of its own, is a smart move by Adobe. Initially, I was afraid that Adobe would end up keeping us on the same old tendentious work-around settings, such as the DNG conversion settings. However, it appears that Adobe has innovated using its own approach. There is an inherent issue when dealing with JPEG files - they only support certain embedded RAW metadata that can be displayed in-camera. This is true regardless of whether or not you use the Adobe DNG converter or raw file processing on the computer. However, Adobe is now recognizing this issue and is addressing it. You can now preview raw files before converting them. You can also access the raw file in Direct Media Access (DMA) and read its metadata. You can even add your own custom metadata, which is to be set on the original using Lightroom. This is just a great idea as I may be more likely to use this new feature if I need to apply some very minor adjustments that require minor adjustments to the original file. This is because, once you have loaded a RAW file, you will not be able to access the data physically. That is a shame but, if checking whether or not you have the correct settings is really that simple, Lightroom should be able to do that. This would also be a great feature if you need to blow some dust off your lens and ensure that it doesn't have any scratches before you shoot and do some special effects over the finished image. Yeah, I know this is a new beta, but this is a feature that can help all our photographers.
